Lubmitted (UTN-1999) to the EMBL/GenBank/DDBJ databases.

Lubmitted (UTN-1999) to the EMBL/GenBank/DDBJ databases.

LECOMPLEX (COMPLEX II OR CYTOCHROWE B-CI COMPLEX), WHICH IS A RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

COUPLED TWO HEME GROUPS (BS62 AND B566) WHICH ARE NOT COVALENTLY BOUND TO THE PROTEIN (BY SIMILARITY).

CTOCARCTOR: TWO HEME GROUPS (BS62 AND B566) WHICH ARE NOT COVALENTLY BOUND TO THE PROTEIN (BY SIMILARITY).

CTOCARCTOR: TWO THE RIESES PROTEIN (BY SIMILARITY).

COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

COPACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY

BOUND TO THE PROTEIN (BY SIMILARITY).

CI SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,

CI SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

CI SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

Bubhitted (SER-2010) to the EmBL/GenBank/DBU databases.

COMPLEX COMPONENT OF THE UBIQUINOL-CYTOCHROME C.

COMPLEX (COMPLEX III OR CYTOCHROME B.C.1 COMPLEX), WHICH IS A

RESPIRATORY CHAIN THAT GENERALES AN ELECTROCHEMICAL POTENTIAL

COUPLED TO ATP SYNTHESIS (BY SIMILARITY)

C. -I CORACTOR: TWO HEME GROUPS (BS62 AND Bs66) WHICH ARE NOT COVALENTLY)

C. -I COPACTOR: TWO HEME GROUPS (BS62 AND Bs66) WHICH ARE NOT COVALENTLY)

C. -I SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B.C.1 ARE: CYTOCHROME B,

CTTOCHROME C.1 AND THE RIESER PROTEIN (BY SIMILARITY).

C. -I SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

C. -I SIMILARITY: AL17842.11 -

C. -I SIMILARITY: AL17842.11 -

C. -I STANICARONE C.1 AND THE RIESER PROTEIN (BY SIMILARITY).

C. -I SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                            This sequence represents complementarity determinating region 3 (CDR L3) of the light chain of murine anti-CD23 (FCERII) monoclonal antibody C11 (see also AAY3262). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of C11 light and heavy chain CDRs (see AAY32264-59) to render them capable of binding to the CO23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, lupus exprhematosus, Hashimoto's thyroidatis, multiple sclerosis, diabetes, uveltis, dermatifis, psoriasis, unlitiple sclerosis, diabetes, uveltis, dermatifis, psoriasis, unlitiple sclerosis, csyndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, 5jogren's syndrome, allergies, allergie cathma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, eczema, graft-versus-host disease, CO9D, insulitis, bronchitis (particularly tronic bronchitis) or diabetes (particularly type I for studying interactions between CD23 and various ligands and cermining the binding agents.
                                                                                       Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -

this sequence represents the light chain variable region (VL) of humanised anti-CD23 (FCERII) monoclonal antibody C11, composed of a human framework (HSTGKVII) and the light chain complementarity determining regions (HSTGKVII) and the light chain complementarity determining regions (HSTGKVII) and the light chain complementarity and was constructed by splice overlap PCR. The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II molecule expressed on the capable of binding to the CD23 type II molecule expressed on the capable of binding to the CD23 type II molecule expressed on the capable of binding to the CD23 type II molecule expressed on the capable of binding to the CD23 type II multiple sclerosis, diabetes, uveatis, defamatitis, psoriasis, multiple sclerosis, diabetes, uveatis, defamatitis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sjogren's syndrome, allergies, allergie asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, eczema, graft-versus-host disease, COPD, insulitis, bronchitis continion the color of the color of

This sequence represents the light chain variable region (VL) of murine anti-CD23 (FCBRII) monoclonal antibody C11. The invention provides altered antibodies, such as chimeric or humanised antibodies (see AAY22262 and AAY32263), which comprises sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions (see AAY32254-59) to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble, CD23 formation in human therapy, for the treatment of arthritis, couple expressed on habences. Washimoto's thyroiditis, multiple sclerosis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sjogren's syndrome, allergies allergic asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, cromn's disease, Sjogren's syndrome, allergies allergic asthma, articularly chronic bronchitis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful convenient the binding and various ligands and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cell receptor specific antibodies useful for treating e.g. arthritis
inflammation, arthritis, lupus erythematosus, multiple sclerosis; Habilmoto's thyroiditis, diabetes; uveitis; benatitis, psoriasis; urticaria, nephrotic syndrome; glomerulomephritis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; inflammatory bowel disease; asthmatory asthma; rhinitis; czema; insulitis; graft-versus-host disease; COPD; bronchitis; diabetes; B-cell malignancy; therapy.

The present sequence is a IDI-1 L3 peptide which comprises the complementarity determining region (CDR) of the light chain of IDI-1 monoclonal antibody (MAb). The IDI-1 mAb is an anti-idiotypic antibody/AD2 mAb specific for PAb-421 which is an Ab1 mAb specific to the C-terminal DNA-binding domain of murine p53 protein. The peptide corresponds to residues 92-110 of IDI-1 light chain variable region. It is an example of the active compound useful in the diagnosis, prevention and treatment of SLE in humans.

The mouse VI gene product may be used to produce chimeric mouse-
human Abs against HIV-1 comprising human Ig constant regions and
murine variable regions. These novel sequence are useful in
treatment, diagnosis and prophylaxis of HIV infections, and may be
produced by a bacterial, yeast or mammalian expression system.
                                                                                                                                                                                                                             New chimeric mouse human antibodies - used in treatment, diagnosis and prophylaxis of HIV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the light (kappa) - chain variable (V) region of a mouse monoclonal antibody (MAb), 2E12, and is specific for an HIV-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New chimeric mouse-human antibodies - used to detect, kill and remove HIV-1 antigen from sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

The present sequence is a light chain variable region of IDI-1 an anti-diotypic antibody/Ab2 monoclonal antibody (mAb) specific for PAb-421 which is an Ab1 mAb specific to the C-terminal DNA-binding domain of murine p53 protein. The Ab1 and Ab2 mAbs and peptides based on complementarity determining regions of light and heavy chain variable regions of these antibodies, are examples of active compounds useful in the diagnosis, prevention and treatment of SLE in humans.

AAW39821-23 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 2A10, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2A10 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2A10 has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo

viral antigen. It is used in the construction of a chimeric MAD comprising heavy and light chains having murine V regions and human C regions. The chimeric MADs are more effective than murine MAD 2812 since they have an increased compatibility in humans. The heavy and light chain V-regions are joined by manipulating their respective joining (J) regions, to generate restriction enzyme recognition sites. The chimeric MADs can be used as immunoconjugates, in association with e.g. toxins for HIV treatment. See also AAQ12057-63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by

A series of cocaine transition state analogues (TSAB) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mouse, humanised antibody, CC-chemokine receptor 2, CCR2, nephrotropic, neuroprotective, immunosuppressive, human immunodeficiency virus, HIV infection; cytostatic; vasotropic; leukocyte trafficking, allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transitions state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl occaine, The 2AhO antibody (AAW39809 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2AlO has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can
                                                                                                       Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The patent discloses a humanised antibody or its antigen-binding fragment, having binding specificity for CC-chemokine receptor 2 (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin. The manied antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting or treating CCR2. They are useful for inhibiting or treating cell subject of lateovyte trafficiary for treating CCR2-andised disorders such as their inhibiting restences; attended and atherosclerosis, arthritis and multiple sclerosis, atherogenesis and atherosclerosis, and for inhibiting restences; attended sorders such as affor inhibiting restences; attended sorders such as and for inhibiting restences; attended allergy, anaphylaxis, and in the manufacture of a medicament for treating CCR2-2 mediated disease. They are useful in therapy or diagnosis, and in the manufacture of a medicament of interacting creation, shock, stenosis, allograft rejection, filteractic disease, asthma, inflammatory glomerulopathies, acquired increvention, including angioplasty and/or stent placement in a mammal. The present in a mammal, and inhibiting neointimal hyperplasia of a vessel in a mammal, and inhibiting modifical inflammal, and subject of the present sequence is mouse germline kappa light chain variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
inflammatory disorder; autoimmune disorder; rheumatoid arthritis; shock; multiple sclerosis; atherogenesis; atherosclerosis; restenosis; asthma; anaphylaxis; malignancy; inflammation; stenosis; allograft rejection; fibrotic disease; angioplasty; acquired immune deficiency syndrome; AIDS; inflammatory glomerulopathy; vascular intervention; neointimal hyperplasis; VK; kappa light chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Humanized immunoglobulin for treating a CC-chemokine receptor 2-mediated disorder in a patient, comprises a binding specificity for CCR2, and a non-human antigen binding region and human immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3B9 antibody (AAW39806 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAW39815-17 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 389, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 31+Denzoic acid from 31+Phenyl cocaine. The 389 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 389 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that

AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occaine. A series of cocaine pransition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release silf-benzoic acid from 3H-phenyl occaine. The 12H1 antibody (AAW39808 represents the heavy chain) was identified using TSA2, and has a per minute Kcat of 0.016. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                          New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WSX*receptor and related antibodies and ligands - used to develop products for diagnosis and therapy, e.g. for improving haematopoigsis or for treating tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ligand; activator; antibody; agonist; proliferation; obserty; differentiation; anaemia; treatment; neoplasia; arteriosclerosis; Type II diabetes; polycystic ovarian disease; cardiovascular disease; postcoarthritis; dermatological disorder; hypertension; insulin resistance; hypercholesterolaemia; hypertriglyceridaemia; cancer; cholelithiasis.

The present sequence is an agonist antibody clone to the human WSX receptor, which can be used to identify and purify ligands and activators. An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor, leading to enhanced proliferation or differentiation of a cell expressing the WSX receptor. It can also differentiation of a cell expressing the WSX receptor. It can also intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or contake in an obese mammal. WSX receptor ligands can be used to expecially a human is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to repopulate marrow transplantation therapy. It can also be used to repopulate collocation therapy. It can also be used to repopulate to look cells in a mammal. The products can also be used to repopulate collocation disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, cardiovascular diseases, cardiovascular diseases, can cholelithiasis.

US-09-973-451-10

Sequence 10, Application US/09973451

Patent No. US2002013228A1

GENERAL INFORMATION:
APPLICANT: JACOBSON, Myron K.
APPLICANT: JACOBSON, Minston
TITLE OF INVENTION: GENES ENCODING SEVERAL POLY (ADP-RIBOSE) GLYCOHYDROLASE
TITLE OF INVENTION: THE REQUEST THEREOF, AND ANTIBODIES IMMUNOREACTIV
TITLE OF INVENTION: THE PROTEINS AND FRAGMENTS THEREOF, AND ANTIBODIES IMMUNOREACTIV
TITLE OF INVENTION: THE PROTEINS AND FRAGMENTS THEREOF, AND ANTIBODIES IMMUNOREACTIV
TITLE OF INVENTION: THE PROTEINS AND FRAGMENTS THEREOF, AND ANTIBODIES IMMUNOREACTIV
TITLE OF INVENTION: THE PROTEINS AND FRAGMENTS THEREOF, AND ANTIBODIES IMMUNOREACTIV
TITLE OF INVENTION INVERSE: US/09/302,812

CURRENT FILING DATE: 1999-04-30

PRIOR APPLICATION NUMBER: 60/083,768

PRIOR APPLICATION NUMBER: 60/083,768

PRIOR APPLICATION DATE: 1999-05-01

NUMBER OF SEQ ID NOS: 38

LENGTH: 766

TURENT: 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 4, Application US/10164359

Sequence 97. Application US/09144886
; Patent No. US20020155114A1
; GENERAL INFORMATION:
    APPLICANT: Marks, James D
    APPLICANT: Marks James D
    TITLE OF INVENTION: Therapeutic Monoclonal Antibodies That Neutralize
    TITLE OF INVENTION: Botulinum Neurotoxins
    TITLE OF INVENTION: Botulinum Neurotoxins
    TILE REFERENCE: 250.171780
    CURRENT APPLICATION NUMBER: US/09/144,886
    CURRENT APPLICATION NUMBER: 1998-08-31
    NUMBER OF ERQ ID NOS: 98
    SOFTWARE: Patentin Ver. 2.0

"Cloning and sequencing of ampC and ampR genes from Providencia
stuartii.";
Submitted (MAY-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THIS PROTEIN IS A POSITIVE REGULATOR OF GENE EXPRESSION
OF BETA-LACTAMASE (AMPC).
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: BELONGS TO THE LYSR FAMILY OF TRANSCRIPTIONAL

Zuniga M., Champonier-Verges M., Zagorec M., Perez-Martinez G.;

Structural and functional analysis of the gene cluster encoding the enzymes of the arginine deiminase pathway of Lactobacillus sake.";

4. Bacteriol. 180:4154-4159(1998).

-i- FUNCTION: CATALYZES AN ELECTRONEUTRAL EXCRANGE BETWEEN ARGININE AND ORNIHINE TO ALLOW HIGH-FFFICIENCY ENERGY CONVERSION IN THE ARGININE DEIMINASE PATHWAY (BY SIMILARITY).

-i- SUBCELLULAR LOCATION: Integral membrane protein (Potential).

-i- SIMILARITY: BELONGS TO THE ARCD/CADB/GERAB/LYSI FAMILY OF
                                                                         phosphate.
--- PATHMAY: Arginine degradation via arginine deiminase; third step.
--- SUBUNIT: HOMODIMER (PREDOMINANTLY) AND HOMOTETRAMER.
--- SUBCELLULAR LOCATION: Cytoplasmic (Potential).
--- SIMILARITY: BELONGS TO THE CARBAMATE KINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Mol. Gen. Genet. 241:33-41(1993).

-I- FUNCTION: THIS IS A COMPONENT OF THE PHOSPHOENOLPYRUVATE-DEPENDENT
SUGAR PHOSPHOTRANSFERSE SYSTEM (FTS), A MAJOR CARBOHYDRATE ACTIVE
TRANSPORT SYSTEM. THE IICD DOMAINS CONTAIN THE SUGAR BINDING SITE
AND THE TRANSMERANE CHANNEL; THE IIA DOMAIN CONTAINS THE PRIMARY
PHOSPHORYLATION SITE (THE DOWNE IS PHOSPHO-HPR); IIA TRANSFERS IT TO
PHOSPHORY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-0CT-1996 (Rel. 34, Created)

-!- CATALYTIC ACTIVITY: ATP + glycine + tRNA(Gly) = AMP + diphosphate
-!- + glycyl-tRNA(Gly).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: BELONGS TO CLASS-II AMINOACYL-TRNA SYNTHETASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         STRAIN=K1;

MOI. BIOL. 224:639-657(1992).

-!- FUNCTION: THIS COLICIN IS A CHANNEL-FORMING COLICIN. THIS CLASS OF TRANSMEMBRANE TOXINS DEPOLARIZE THE CYTOPLASMIC MEMBRANE, LEADING TO DISSIPATION OF CELLULAR ENERGY.

-!- FUNCTION: COLICINS ARE POLYEPETIDE TOXINS PRODUCED BY AND ACTIVE AGAINST, ESCHERICHIA AOLI AND CLOSELY RELATED BACTERIA.

-!- SIMILARITY: BELONGS TO THE CHANNEL FORMING COLICIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Morlon J., Lloubes R., Varenne S., Chartier M., Lazdunski C.; "Complete nucleotide sequence of the structural gene for colicin A, a gene translated at non-uniform rate."; J. Mol. Biol. 170:271-285 (1983).

                                                                                                                                                                          Pagens W., Schel P.O., Nies D.H.;
Backens W., Scheel P.O., Nies D.H.;
Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.
Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.
-I. FUNCTION: HAS A LOW CATION TRANSPORT ACTIVITY FOR CO(2+), IT IS
-ESSENTALE FOR THE EXPRESSION OF COBALT, ZNC, AND CADMIUM
RESISTANCE. CZCA AND CZCB TOGETHER WOULD ACT IN ZN(3+) EFFLUX
NEARLY AS EFFECTIVELY AS THE COMPLETE CZC EFFLUX SYSTEM (CZCABC).
-I. SUBCELLIAGAR LOCATION: Integral membrane protein (Probable).
-I. INDUCTION: BY CADMIUM, COPPER AND ZINC.
-I. SIMILARITY: BELONGS TO THE ACRB/ACRD/ACRF FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            유
                                                                                                                                                                                                                                                                                                                                                                                                                o,
                                                                                                                    This sequence represents complementarity determinating region 1 (CDR HI) of the heavy chain of murine anti-CD23 (FCERII) monoclonal antibody C11 (see also AAY32263). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise utilities to the amino acid sequences of C11 light and heavy chain CDRs (see AAY3254-59) to render them. Teapable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, lupus exthematous, Hashimoto's thyroiditis, multiple sclerosis, clabetes, uveit1s, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sjogran's syndrome, allergies, allergic asthma, intrinsic asthma, acte asthma, acted asthma, colitis, bronchitis or czema, graft-versus-host disease, CODP, insulitis, bronchitis disbetes), and B-cell malignancies (claimed). They are also useful for etermining the binding agents.
                                                          Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -

This sequence represents the heavy chain variable region (VH) of murine anti-CD23 (FCERII) monoclonal antibody Cl1. The invention provides altered antibodies, such as chimeric or humanised antibodies (see AAY32262 and AAY32263), which comprises sufficient of antibodies (see AAY32262 and AAY32263), which comprises sufficient of the amino acid sequences of the Cl1 light and heavy chain complementarity determining regions (see AAY32254-59) for render them capable of binding to the CD23 type II molecule expressed on hammatopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, lubus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, clubus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, lubus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, claberes, uveltis, dermatitis, psoriasis, uritoraria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulerative colitis, trohn's disease, is spring, asthma, acute asthmatic excension; xinnitis, eccema, graft-versus-host disease, COPD, insulitis, bronchitis (particularly tronic bronchitis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful cetermining the binding agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGITG-ABL30511), expressed DNA sequences (ABLIGITG-ABL30511),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                  Drosophila, developmental biology; cell signalling; insecticide; pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; SEQ ID NO 12810; 21pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This amino acid sequence represents the heavy chain of humanised anti-CD23 (FCERI) monoclonal antibody C11, composed of a human framework (HSIGKVI) and the heavy chain complementarity determining regions (see AAY32257-59) of murine antibody C11. The DNA was constructed by splice overlap PCR. The invention provides altered antibodies, such as chimaris or humanised antibodies, which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions to render them comprise sufficient of the maino acid sequences of the C11 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II molecule expressed on hamancopoietic cells. The antibodies are used to block soluble charactoric in human therapy, for the treatment of arthritis, lugus erythematorous, Hashimoto's hypoiditis, multiple solerosis, clabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, crohn's disease, Sjogram's syndrome, allergies, allergies cathma, intrinsic asthma, acte asthmatic exacerbation, rhinitis, estema, graft-versus-host disease, COPD, insulitis, bronchitis (particularly chronic bronchitis) or diabetes (particularly chronic bronchitis) or diabetes (particularly chronic bronchitis) or diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 33; DB 21; Length 444; 100.0%; Pred. The abtides are identified from random peptide libraries using specific ligand binding. Abtides mimic the binding specificity of large molecules such as antibodies and receptors but have a much smaller size allowing their production at a lower cost and reducing the extent of their immunogenicity aiding in vivo delivery. The abtides are useful for the diagnosis, detection, imaging and treatment of disease, e.g. tumours, prostate cancer and breast
                                                                                                                                                                                                                                                                                    New isolated peptide(s) with specific binding activities - obtd. by screening random peptide libraries, for use in diagnostic and therapeutic compsns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          90.9%; Score 30; DB 17; Length 43; 80.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated polymuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polyperide are also used in diagnostics as expressed sequence tags for identifying expressed sequence. (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving contrating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in dispositios, foremsics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Aggioungland or appear in the printed agancetic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the vive or the produces.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Abtide, prostate specific mucin antigen, human prostate cancer; LNCaP; diagnostic, detection; imaging; tumour; phage; peptide library; breast; polymorphic; epithelial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forenaics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                          This invention describes novel isolated human secreted proteins and their encoding nucleic acid sequences. The products of the invention are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the presence or amount of expression of the new polypeptides in a sample or by determining the presence or absence of mutations in the new polynucleotides. Specific uses are described for each of the 70 polynucleotides. Specific uses are the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune of sections in the section of all diseases, lamphomas, inflammation, allergies, asthma, seppis, diabetes, halphimer's and cognitive disorders, schizophrenia, osteoporosis, arthritis, psoriasis, digestive/endocrine clinomare represented in AAX37169-X37441.

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent critis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune disorders and neuronal disorders

Claim 1; SEQ ID No 892; 880pp; English

The invention relates to novel isolated polypeptides (I),

```
polynucleotides (II). (I) (II) and the antibody to (I) are useful for diagnosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiancies, autoimmune tisorders (e.g. congenital and acquired immunodeficiancies, autoimmune transplant rejections and graft versus host disease, infectious diseases (e.g. hepatitis O.) bleeding disorders, hemoglobin abnormalities and cher blood-related disorders (e.g. hepatitis disorders (e.g. disorders (e.g. disorders), primary haematopoietic disorders, hyperproliferative disorders, primary haematopoietic disorders, hyperproliferative disorders (e.g. disorders (e.g. disorders), neurodegenerative disorders (e.g. disorders (e.g. disorders), respiratory disorders (e.g. stroke), renal alsorders (e.g. g. domerulonephritis), cardiovascular disorders (e.g. disorders) in respiratory disorders, dermatological disorders, in wound healing, epithelial cell proliferation, endocrine disorders (e.g. dadisorder) reproductive system disorders (e.g. disorders), inversional disorders (inflammatory disorders), liver disorders (cirrhosis), as stimulators of B-cell responsiveness to pathogens, activators of T-cells, to induce higher affinity antibodies, and as means to induce tumour proliferation in pathologies e.g. acquired immune deficiency syndrome (AIDS). AAU1705-AAU17083 represent novel signal transduction con pathoway protein, amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Murison JG;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Skin; dermal papilla; keratinocyte; neonatal foreskin fibroblast; embryonic skin cell; keratinocyte stem cell; transit amplifying cell; secreted; transmembrane; inflammation; cancer; neurological disease; angiogenesis; tumour vasculfastion; growth disorder; developmental disorder, skin wound; hair follicle disorder; anti-inflammatory; cytostatic; neuroprotective; vulnery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polynucleotides useful for the treatment of various conditions

The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammmatory disease, cancer and
dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to transit inflamation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of concer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences ANYTS942-Y76121 represent polypeptides encoded by the properties of the control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Murison JG;
                                                                                                                                                                                                                                                                                       by CDNA sequences derived from several mouse, rat or human skin cell types. Sequences AAY75942-Y75947, AAY76020-Y76021, AAY760094-Y76109 and AAY7619 are proteins with an N-terminal signal sequence, indicating that they are secreted. Sequences AAY75986-Y75989, AAY76001-Y76071, AAY76106-Y76109 and AAY76121-Y76122 are proteins with one or more putative transmembrane domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            disorders and encoding polypeptides used for treating inflammatory disease, cancer and neurological diseases -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of CDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammarcory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a polypeptide of the invention.

The present invention provides the protein and coding sequences of cDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a polypeptide of the invention.

                                                                                                                                                                                                                                                                                                                                        The present invention provides the protein and coding sequences of cDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a polypeptide of the invention.
                                                                                                                                                                                                                                                  New polynucleotides and polypeptides encoded by the polynucleotides isolated from skin cells, useful for treating skin wounds, cancers, growth and developmental defects, inflammatory diseases, or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Staphylococcus epidermidis ORF amino acid sequence SEQ ID NO:4114.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABP39269 standard; Protein; 243 AA.

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to sorcem for compounds able to interfere with the S. epidermidis liferion. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
